LOCATED:
Littleton, CO

EDUCATION

Bachelor of Science, Computer Science
Colorado State University
Graduated 2025

PROJECTS

Portfolio Webserver

React | Raspberry Pi | Apache
Mar 2025 - Present

My portfolio site, self-hosted on a Raspberry Pi. I moved it from PHP to React and Vite and got load times under a second. I handle the DNS, Apache config, SSL certs and uptime monitoring myself on the Pi, with secure tunneling for lightweight edge hosting.

Game Prototypes

Lua | Pico-8 | Godot

Small games built inside hard limits, like Pico-8's 128x128 pixels and 8,192 tokens of Lua. I focus on tight gameplay loops and creative ways to work inside those limits. Playable at nkiv.itch.io.

Personal Automation

Software tools I build for cost saving and automation in my personal life.

AT A GLANCE

- **500+** test failures resolved
- **10+** services modernized
- **30 min+/each run** saved with health checks
- **Built** a Python triage toolchain
- **Built** a response simulation plugin

SUMMARY

Backend engineer on Charter Communications' OAuth2/OIDC identity platform, which handles login and token refresh for consumer and enterprise products across more than a hundred components. I own platform releases and the regression suite that gates merges, trace failures through Java, service mesh, Kubernetes and AWS until I understand them, and use AI agents and skills to speed up the work I repeat most.

EXPERIENCE

Software Developer I

Greenwood Village, CO
Charter Communications · OAuth Platform Team — *Nov 2025 - Present*

RELEASE MANAGEMENT

- Own platform releases: sequence rollouts across environments, write change records and release notes, keep the release calendar up to date, and run pre-prod deployments
- Update leadership on release status daily

TEST AUTOMATION & QUALITY

- Resolved 500+ regression failures by tracing each one to its root cause: code defects, test defects, bad test data, or upstream dependencies
- Triaged before/after test summaries to find failure clusters and fix them before leaving pre-production
- Built WireMock integration test suites for OAuth flows bringing coverage +30%

ENGINEERING

- Fixed a circuit breaker that could never open because a new one was created on every request; replaced it with one shared Resilience4j instance across 3 repos
- Modernized 9 services: Java 11 to 21, Spring Boot 2.7 to 3.x, and Spring Data for Cassandra and reactive Redis
- Moved a service pipeline off static cloud credentials and onto short-lived, role-based AWS credentials
- Designed and built a response simulation plugin for the performance team that returns delays, status codes and bodies by percentage

AI TOOLING

- Built agent skills and a Python triage toolchain: regression runs get a verdict in under a minute, and a 3-second pod check replaces a 30-minute test run
- Connected agents to the team's ticketing, docs, code and logging tools (MCP), each with only the access it needs

IT Help Desk Technician

Fort Collins, CO
CSU Engineering Technology Services — *Oct 2023 - May 2025*

- Built, repaired and deployed systems for engineering students and staff
- Troubleshot issues in person, by phone, and remotely through FreshService, RDP and TeamViewer

SKILLS

Languages: Java, Python, Bash, JavaScript, C++, Lua, SQL/CQL

Frameworks: Spring Boot, Spring Data, Resilience4j, TestNG, JUnit 5, WireMock, React

Cloud & Data: AWS (IAM, STS, Kinesis), Kubernetes, Helm, Istio/Envoy, Docker, Cassandra, Redis, Kafka

DevOps & AI: GitLab CI, Splunk, Datadog, MCP, agent skills, knowledge bases

Protocols: OAuth 2.0, OpenID Connect, JWT/JWE/JWS, SAML 2.0, mTLS, REST
